

B - Express Pizza Route

// Express

Goal

Use route parameters to customize requests

Background

Another way to give parameters to our express endpoints is using **Route Parameters**. Let's say each pizza order is assigned an incremental order ID. We'd like to give our users a way to review their order under the `/review` route.

We can create a new review page for every order id as follows:

```
app.get("/review/:orderid", (req, res) => {  
  res.send(req.params.orderid)  
})
```

Just like the `res.query` object, the `res.params` object maps each named route parameter to its value.

Now we can request the page `/review/42` and we'll get back the value 42.

Note that a URL can contain more than one route parameter: `/user/:uid/photos/:file` for example.

Description

Upgrade your Express Pizza app to save each order in a map with the incremental order id as the key.

Then, create the `/review/:orderid` endpoint that will send a simple HTML page following the template:

```
REVIEW_TEMPLATE = '<h1>Order ${orderid}:</h1>
<h2>Toppings:</h2>
<p>${toppings}</p>
<h2>Crust:</h2>
<p>${crust}</p>
<h2>Total: ${price}$<h2>'
```
