

Pizza in the POST

Background

With express we can also handle other HTTP methods, for example POST requests:

```
app.post('/submit', (req, res) => {  
  // Handle post request  
})
```

If you'll recall from the HTTP topic, data submitted using POST is not encoded in the request URL. Instead, it's attached in the request body.

To access this data from express, we need to use the **body-parser** middleware:

```
const express = require('express');  
  
app.use(express.urlencoded());
```

Now that we've done that, we can access the data encoded in the POST request body easily:

```
app.post('/submit', (req, res) => {  
  console.log(req.body.extraCheese)  
})
```

Description

Update the pizza ordering app to use POST instead of GET.

Bonus: write an HTML form to test your server code.

To Submit

A zip file containing your code.
