

Whos There

// Login

Goal

Use a JSON file to store user credentials

Background

We learned how to use JSON in order to store our data. Using a file instead of a hardcoded dictionary the advantage that our data is no longer **volatile**, meaning it's stored on the disk instead of in the program memory. So, if our server restarts, our data will still be there

Description

Download the template `whos_there_template.zip`. then:

1. Add at least 2 more users to the JSON file
2. In the `data.js` file, implement a function that reads and parses the stored user data
3. Update the `/login` route in `login.js` to use the stored data to determine whether a login is valid

To Submit

A zip file containing your code.
