

B - Partials

// Views

Background

Some elements in our HTML code will, in many cases, repeat many times throughout our websites.

For example, a photo gallery, a comment section, social media buttons, etc.

Instead of copy and pasting the code for each of these again and again, we can use a neat feature of EJS to take care of it for us: **partials**.

A partial is just an ejs file that can be **included** in other ejs files.

Example

We'll create a new **partials** directory under the **views** directory and in a **social.ejs** file:

```
<div class="social-media-buttons">
  <button class="fb">Facebook</button>
  <button class="ig">Instagram</button>
  <button class="tw">Twitter</button>
</div>
```

Now, from any one of our views we can include this partial:

```
<h1>Some stuff here</h1>
<%- include("partials/social.ejs") %>
```

The partials can also take parameters (like our views themselves). In `social.ejs`:

```
<% for (platform of social) { %>
  <button class="<%= platform.class %>"><%=
platform.title %></button>
<% } %>
```

Then in a view that has been passed the `social` parameter in the `res.render` function:

```
<h1>Some stuff here</h1>
<%- include("partials/social.ejs", { social: social
}) %>
```

Description

Extend your fact server.

1. Create a "partials" directory under your "views" directory.
2. Create a `fact.ejs` partial that takes a `fact` parameter and use it in both the `fact` and `all_facts` views.

To Submit

A zip file containing your code.
