

Static Noise

// Express

Background

Our web pages use lots of resources: javascript files, images, css files, fonts, etc. If we had to create a new endpoint for each and every one of these it would be very cumbersome.

Instead, we can automatically serve any file in a given directory on the server. This is normally called the "static" or "public" directory.

Consider the following code:

```
app.use("/static", express.static("static"))
```

This sets up the `/static` route to serve any files under the `static` directory automatically. For example, if we go to `/static/style.css` we will get back a file called `style.css` from the `static` folder.

Description

Modify your code from the last exercise.

Create a "static" directory and in the directory create:

1. A javascript `script.js` file with the code `alert("hi!")`
2. A txt file with a secret message of your choice `secret.txt`

Then:

1. Modify your HTML such that it loads the script.
2. Modify your server such that it will serve the files under the "static" directory (without creating an endpoint for each one).

3. Verify that you're able to access the secret file at the URL `/static/secret.txt`.

4. Verify that the alert is shown when the HTML file is loaded.

To Submit

A zip file containing your code.
