

Secret Biryani

// Express

Goal

Use query string parameters to customize requests

Background

Express is sweet enough to also help us out with parsing the http request.

Remember our discussion of query string parameters? We ordered a few nice pizza's and customized them using the GET parameters, for example:

```
/order?  
size=xl&topping1=onions&topping2=durian&extra_cheese=1
```

Using Express, we can access these parameters easily:

```
app.get("/order", (req, res) => {  
  console.log("Got order with parameters:",  
    req.query)  
  res.sendStatus(200)  
})
```

The output when accessing the above URL will be:

```
Got order with parameters: {  
  size: 'xl',  
  topping1: 'onions',  
  topping2: 'durian',  
  extra_cheese: '1'  
}
```

As you can see, the result is simply a map of our GET parameters. So to print just the size we can use the code:

```
console.log(req.query.size)
```

So easy!

Description

We'll start out small, then work our way up.

In this exercise. Create an express server with the `/secret` endpoint.

If the query string parameter "secret" is set to "Biryani" (`/secret?secret=Biryani`), the server will send the text "Yum!".

Otherwise, the server will send a 404 Not Found error.

To Submit

Submit your code in a javascript file named `index.js`.
